Fig. S1. Still images extracted from video surveys of hull fouling (area surveyed = 0.01 m<sup>2</sup>) on the SA 'Agulhas' during cruises in 2006 to 2008, showing (a) 80% coverage with biofilm, (b) 30% coverage with filamentous algae and 50% coverage with biofilm, (c) 50% coverage with macro algae (*Ulva intestinalis*), (d) 30% coverage with filamentous algae and 70% coverage with macrofauna (*Ciona intestinalis*), and (e) 60% removal of anti-fouling coating
