### Supplement. Spatial abundance patterning in the macrofauna

Figure S1: The abundances of the 10 most dominant species. Closed circles denote where cores were taken over the 350 m sample site (see Fig. 1 in the main paper for illustration). Red closed circles denote zero individuals in that core for the given species. Black and gray (colored differently to show overlapping points) are scaled to the number of individuals in that core. Smallest points represent 1 individual and the largest represent the maximum number of individuals per core found for the given species.
