Marine Ecology Progress Series 595: 157–169 (2018)

Supplement

Table S1. Mean $\delta^{15}\text{N} \pm \text{SE}$ and $\delta^{13}\text{C} \pm \text{SE}$ isotopic values and C:N ratios for intertidal and nearshore subtidal invertebrate and macrophyte species before (0) and after (1) the Pacific herring (*Clupea pallasii*) spawn events on beaches in Quatsino Sound, British Columbia (2011 - 2012). Control beaches are sites that did not experience herring spawn events. At each beach location, five samples were collected, with exception to *Traskorchestia spp.*, where 10 samples were collected.

| Species | Beach | Year | Spawn status (before = 0, after = 1) | $\delta^{15}\text{N} \pm \text{SE}$ (‰) | $\delta^{13}\text{C} \pm \text{SE}$ (‰) | C:N ratio |

Table S2. Results of two General Linear Mixed Models (GLMMs) to explain variation in $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$ levels in macrophyte and invertebrates species collected before and after (variable = time) Pacific herring (*Clupea pallasii*) spawn events on beaches with and without spawn (variable = spawn). Shown are results of type III tests of fixed effects and estimates of covariance parameters for random effects (species, location, and year), including Wald Z statistic and corresponding significance.

| Response variable | Effect | Variable | d.f. | F | Parameter estimate | SE | Wald Z | P |
