- 
- Information was missing from the end of Fig. 2 legend on page 181. This has now been corrected in the PDF version online.

The correct legend should read:

Fig. 2. Average annual grass reference evapotranspiration totals ( $ET_0$ ). In the columns (x-axis) are the average results for the period 1982–2000, the averages based on each of the included general circulation models (GCMs) together (as ScenAvg) and separately for each GCM (CGMR, CSMK3, GFCM21, IPCM4 and MPEH5) for the periods from 2001–2020 and 2061–2080. All sites had increasing levels of  $CO_2$  until 2080 (upper lines of pixels) or increasing levels of  $CO_2$  until 2010 and then between 2010–2080 constant  $CO_2$  (lower lines of pixels)
