- 
- In the 'Materials and methods' section on page 51, we incorrectly stated that 'we used independent observer configuration with full independence' for the analyses.

The correct text should read: 'we used independent configuration with point independence'.

Furthermore, the sentence 'Such an approach is recommended when responsive movements by the animals are likely to occur (see Laake & Borchers 2004 for further details) and there is instability in group cohesion' has been deleted.
