

## NOTE

# Multiple trophic levels in soft-bottom communities

John A. Commito<sup>1,2</sup> & William G. Ambrose, Jr.<sup>2</sup><sup>1</sup> Department of Biology, Hood College, Frederick, Maryland 21701, USA<sup>2</sup> Department of Marine Zoology and Marine Chemistry, University of Oslo, Oslo 3, Norway

**ABSTRACT:** In order to assess the general applicability of recent field experiments with predatory infauna, we searched the literature and found 48 well-documented cases of infaunal consumption by such predators. In 63 % of the cases detailed enough to make a determination, the predators ate other predators. Multiple trophic levels within the infauna are probably a common feature of many soft-bottom communities.

The roles which predatory infauna play in controlling soft-bottom community structure are poorly understood (see Commito & Ambrose [in press] for review). Recent field experiments have demonstrated that predatory infauna (organisms which live within the sediment and ingest benthic animals) are important regulating agents and that multiple trophic levels exist within the infauna (Reise 1979, Commito 1982a, Commito & Shrader in press, Ambrose 1984a,b,c). In order to assess the general applicability of these field experiment results, we searched the literature for evidence of infaunal consumption by predatory infauna. Only results from gut and fecal analyses, feeding trials, laboratory and field observations, and immunological assays were included. Examples of predation inferred from field manipulations were excluded because predatory infauna may have effects other than direct predation mortality. Such effects include induced emigration of prey, sublethal effects on prey, nutrient enrichment from fecal material, sediment modification via creation of biogenic structures, and sediment disturbances (Kneib & Stiven 1982, Commito & Ambrose in press, Commito & Shrader in press).

We found 48 well-documented cases of predation by infaunal polychaetes, nemerteans, amphipods, tanaisids, and gastropods on other benthic organisms (Table 1). Polynoid polychaetes and naticid and melongenid gastropods were considered predatory infauna even though they spend considerable time on the sediment surface. Our findings suggest that predatory infauna are important in many marine communities. Based primarily on information provided in

the works cited, we also included in the table an estimate of the sediment disturbance caused by each predator. Too little information was available to evaluate the other types of non-predation effects.

In 21 of the 48 cases it was impossible to determine whether or not the predators ate other predators; either prey categories were too general (e.g. 'polychaetes') or researchers did not offer predatory infauna as prey to their test animals in feeding trials. In 17 (63 %) of the remaining 27 cases, the predators consumed other predators. We feel that many predatory infaunal species eat other predators and that the existence of multiple trophic levels within the infauna may be a common phenomenon in soft-bottom communities. If so, then analyses of energy flow (Ankar 1977, Mann 1982, Fasham 1984) and community organization (Peterson 1979, Woodin 1983) must continue to be re-evaluated for marine ecosystems.

*Acknowledgements.* Both authors wish to thank the University of Oslo Department of Marine Zoology and Marine Chemistry for support during the preparation of this paper. Additional support came from a BP Petroleum Development Ltd. grant to the University of Oslo, a Hood College Board of Associates Faculty Development grant to J. A. C., and a Royal Norwegian Council for Scientific and Industrial Research postdoctoral fellowship to W. G. A., Jr.

Table 1 Direct evidence of infaunal consumption by predatory infauna. Results from gut and fecal analyses, immunological assay, feeding trial, laboratory observation, and field observation studies

Predator	Life position in sediment	Location of prey capture	Sediment disturbance	Macrofaunal prey	Method of prey determination	Source	Comments
<b>POLYCHAETA</b>							
<b>Polynoidae</b>							
<i>Harmothoe sarsi</i>	Surface, shallow	Surface, shallow	Slight	Amphipods (esp. <i>Pontoporeia affinis</i> ), <i>Macoma balthica</i> , <i>Harmothoe sarsi</i> , oligochaetes	Gut analysis	Sarvala 1971	Diet changes with age; large worms feed almost exclusively on <i>Pontoporeia affinis</i>
<b>Hesionidae</b>							
<i>Nereimyra punctata</i>	Shallow	Surface, shallow	Slight	Polychaetes (esp. <i>Prionospio</i> spp.), amphipods	Gut and fecal analyses, feeding trials	Oug 1980	Lives in gallery; responds to tactile and chemical cues from prey
<i>Ophiodromus flexuosus</i>	Surface, shallow	Surface, shallow	Moderate	Polychaetes (esp. <i>Prionospio</i> spp.), crustaceans, gastropods, bivalves	Gut and fecal analyses, feeding trials	Oug 1980	Responds to moving prey, creeps along surface
<i>Podarke pugettensis</i>	Surface, shallow	Surface, shallow	Moderate	Polychaetes (11 families), tanaids, isopods	Gut and fecal analyses, feeding trials	Shaffer 1979	Responds to moving prey; usually rejects large prey
<b>Nereidae</b>							
<i>Nereis diversicolor</i>	Surface, shallow, deep	Shallow, deep	Slight	<i>Arenicola marina</i>	Laboratory observation	Witte & de Wilde 1979	Invades prey burrows; bites off tails or kills prey
<i>Nereis diversicolor</i>	Shallow	Surface	Moderate	<i>Corophium volutator</i>	Laboratory observation	Olafsson & Persson unpubl.	Disturbs prey burrows; attacks prey only on sediment surface
<i>Nereis succinea</i>	Surface, shallow, deep	Surface, shallow	Moderate	Amphipods (esp. <i>Corophium lacustre</i> , <i>Leptocheirus plumulosus</i> ), nereid polychaetes	Gut analysis	Haddon & Hines unpubl.	Feeds primarily on surface organisms > 1 mm long
<i>Nereis virens</i>	Surface, shallow, deep	Surface, shallow	Moderate	Polychaetes, oligochaetes, bivalves, amphipods	Fecal analysis	Ambrose 1984b	Moves anterior part of body out of burrow across sediment surface to attack prey
<b>Nephtyidae</b>							
<i>Nephtys caeca</i>	Shallow, deep	Shallow, deep	Slight	<i>Rhepoxynius abronius</i>	Feeding trials	Ambrose 1984d	Causes prey to leave sediment and enter water column
<i>Nephtys cirrosa</i>	Shallow, deep	Shallow, deep	Slight	Polychaetes ( <i>Nephtys</i> spp., possibly malidanids and spionids)	Gut analysis	Clark 1962	Many guts empty or containing sediment
<i>Nephtys hombergi</i>	Shallow, deep	Shallow, deep	Slight	Polychaetes (esp. spionids)	Gut analysis	Clark 1962	Many guts empty or containing sediment
<b>Glyceridae</b>							
<i>Glycera alba</i>	Shallow, deep	Surface, shallow	Slight	Many polychaete species (esp. errant forms), amphipods	Fecal analysis, feeding trials	Ockelmann & Vahl 1970	Responds to moving prey; lives in gallery; injects toxin
<i>Glycera convoluta</i>	Shallow, deep	Surface, shallow	Slight	<i>Nephtys caeca</i>	Feeding trials	Ambrose 1984d	Lives in gallery; causes prey to leave sediment and enter water column
<i>Glycera dibranchiata</i>	Shallow, deep	Surface, shallow	Slight	<i>Nereis virens</i> , <i>Macoma balthica</i> , <i>Corophium volutator</i>	Fecal analysis, feeding trials	Ambrose 1984b	Lives in gallery; injects toxin
<b>Spionidae</b>							
<i>Pseudopolydora kempfi</i>	Shallow	Surface	Moderate	<i>Abarenicola pacifica</i>	Gut analysis, feeding trials	Wilson 1981	Feeds on juvenile worms
<i>Pygospio elegans</i>	Shallow	Surface	Moderate	<i>Abarenicola pacifica</i>	Gut analysis, feeding trials	Wilson 1981	Feeds on juvenile worms
<b>Terebellidae</b>							
<i>Eupolyommia heterobranchia</i>	Shallow, deep	Surface	Moderate	Polychaetes, amphipods	Fecal analysis, feeding trials, laboratory observation	Wilson 1980	Feeds on small forms
