Top-down trophic shifts in Florida Keys patch reef marine protected areas

K. Lindsey Kramer*, Kenneth L. Heck Jr

Marine Ecology Progress Series 349:111–123, 2007

- On page 119, in both Fig. 5 and Fig. 6, the key was reversed. The corrected figures are shown here with their captions.

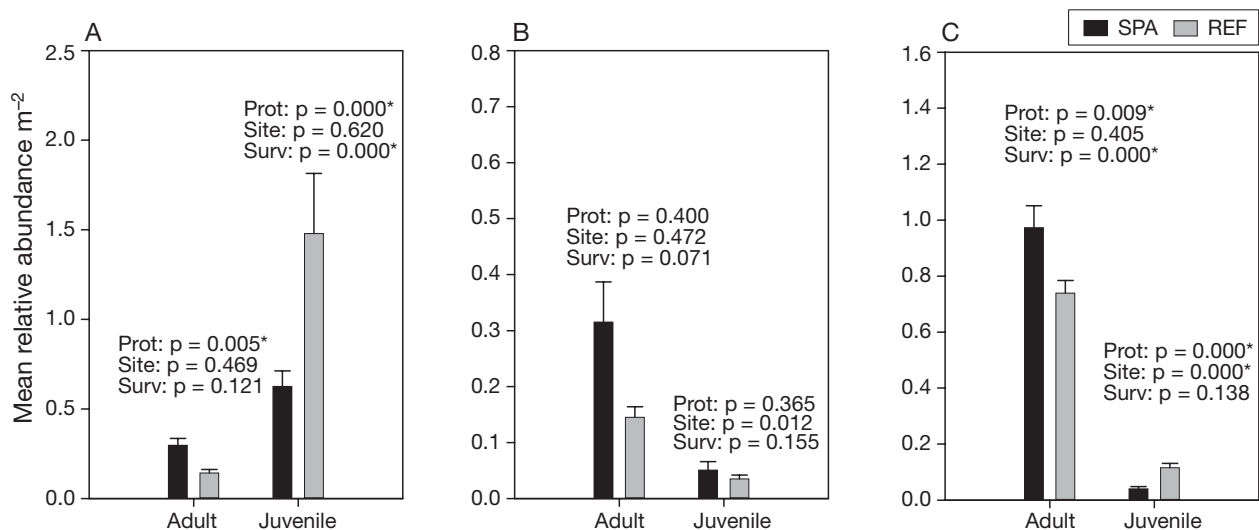

Fig. 5. Mean abundances of (A) scarids, (B) acanthurids and (C) pomacentrids, grouped by life phase; p-values listed for each factor related to herbivore abundance: protection level (Prot), site and survey day (Surv), see Table 1; * = significant

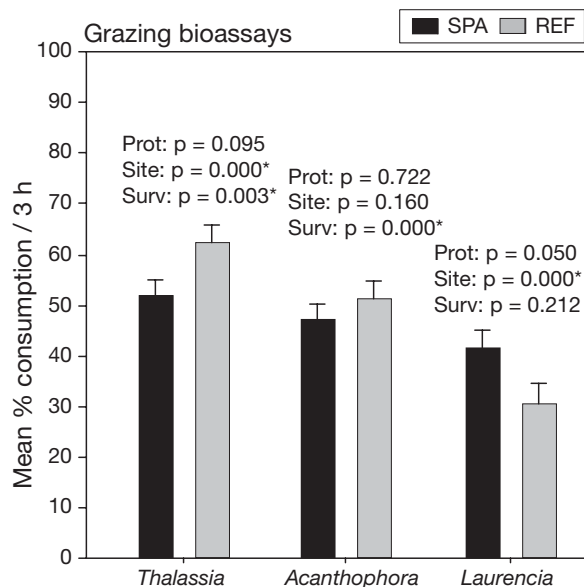

Fig. 6. Mean percent consumption in 3 h period of seagrass (*Thalassia testudinum*) and macroalgal (*Acanthophora spicifera* and *Laurencia papillosa*) bioassays; p-values listed for each factor related to experimental grazing: protection level (Prot), site and survey day (Surv), see Table 1; * = significant
