Marine Ecology Progress Series 508: 67–85 (2014)

Supplement. Morphologies of typical sulfide minerals and possible microbe-like microstructures (Fig. S1), phylogenetic tree of part bacterial populations (Fig. S2), the distribution of representative archaeal and bacterial 16S rRNA gene phylotypes (Table S1 and S2), and the abundance of microbial 16S rRNA genes (Table S3) in different subsampling positions.

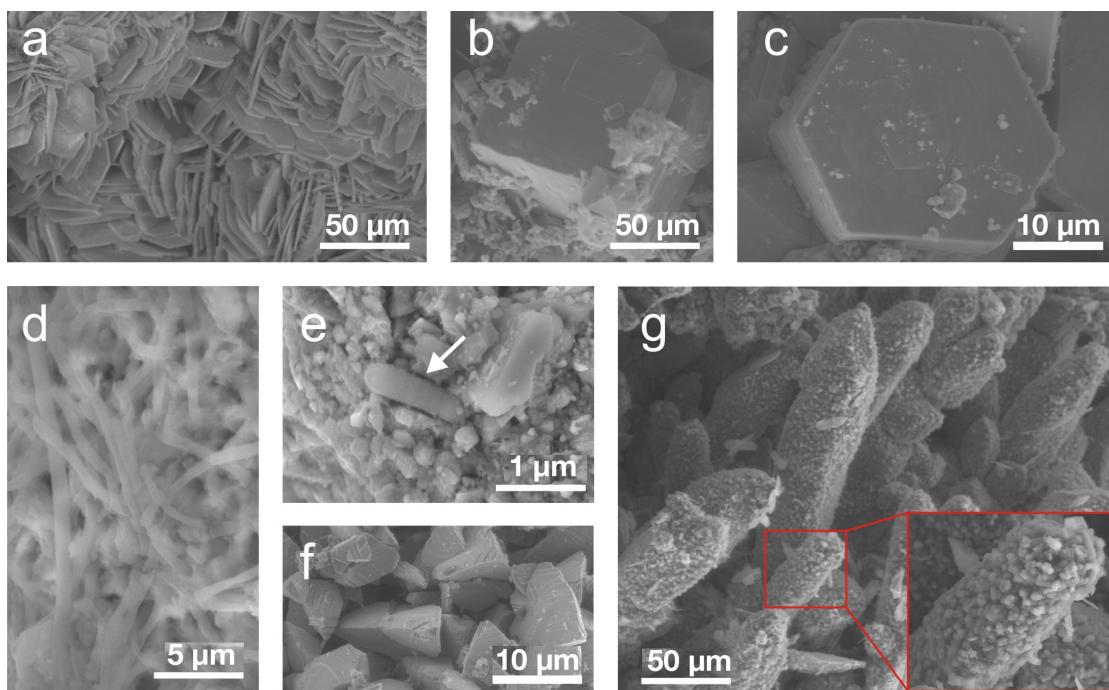

Fig. S1. Scanning electron microscope images of mineral particles and possible microbe-like structures detected in the Dudley hydrothermal sulfide chimney. Typical crystal structures included (a) barite, (b) pyrite, (c) sphalerite/wurtzite, (f) chalcopyrite, and (g) amorphous silica spherules (SiO_2) in the spaces among mineral grains or on the surface. (d), (e) Possible microbe-like structures which were filamentous or rod-shaped (arrow in panel (e))

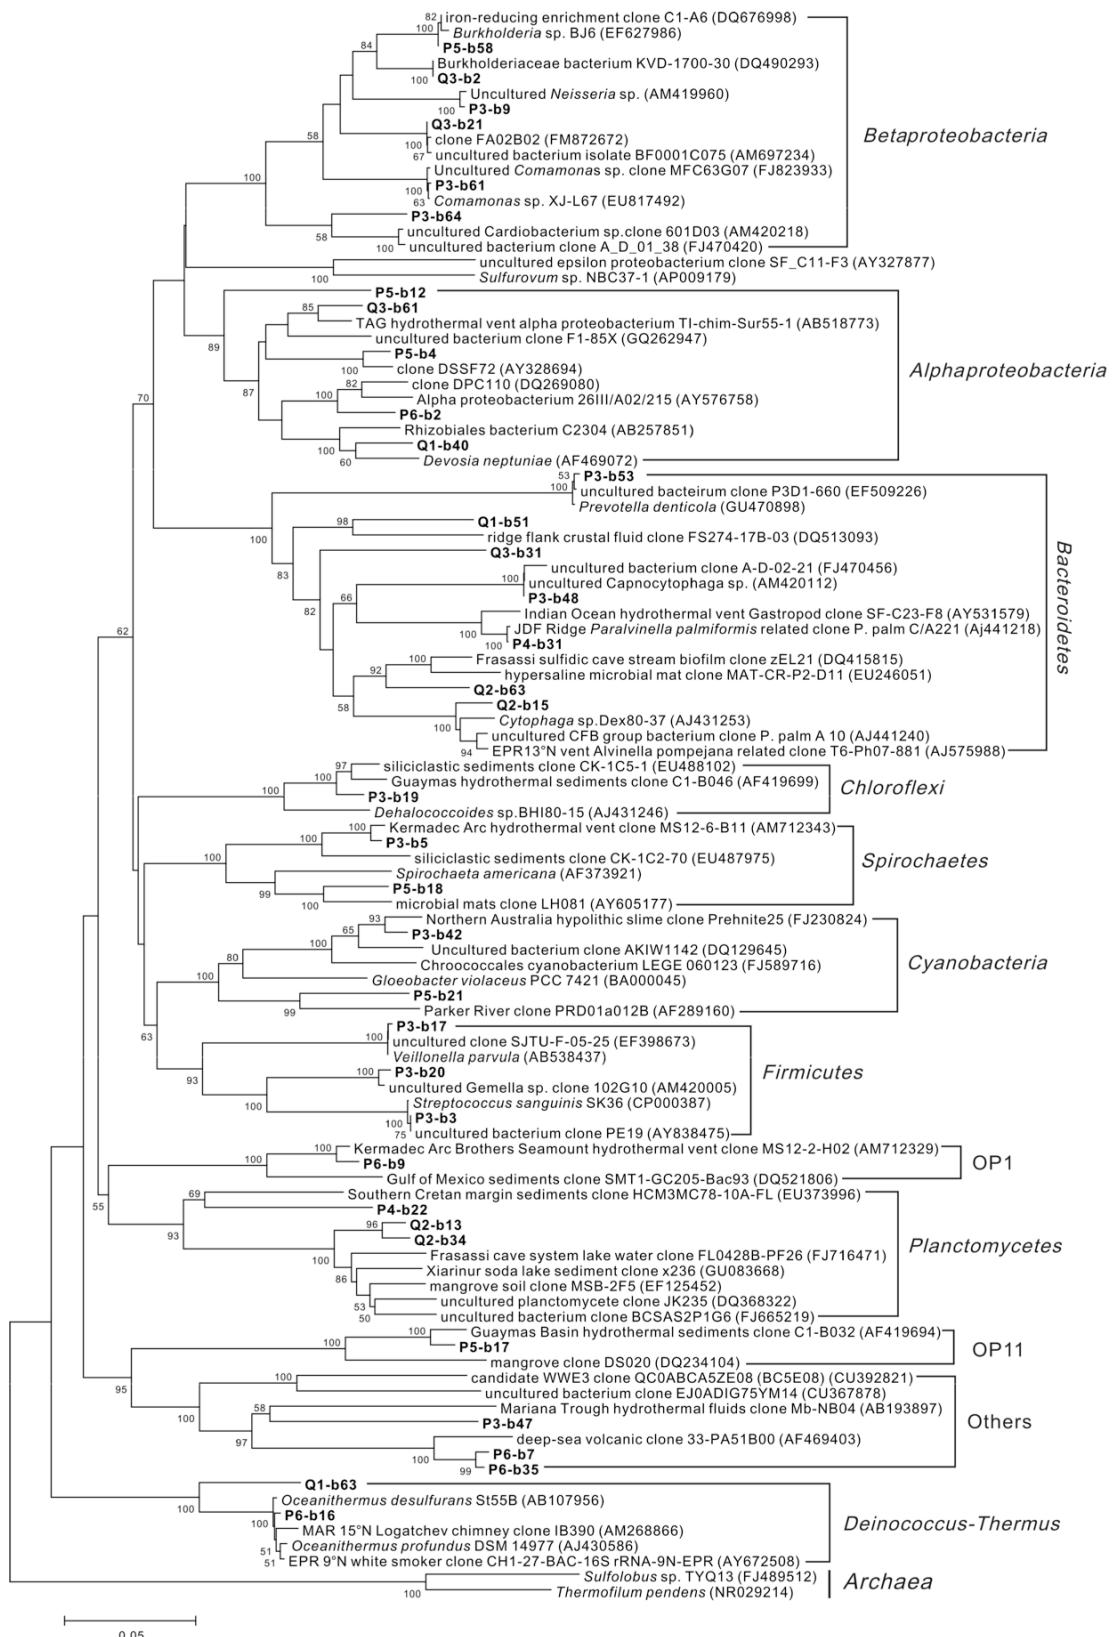

Fig. S2. Phylogenetic tree of bacterial populations, not including *Epsilon*-, *Delta*-, and *Gammaproteobacteria* groups. The scale bar represents the expected number of changes per nucleotide position

Table S1. Distribution of representative archaeal 16S rRNA gene phylotypes and corresponding clone numbers analyzed in different subsampling positions of the Dudley hydrothermal sulfide chimney. See Fig. 2 in the main text for details on the subsampling positions. MGI: marine group I, UC: unclassified *Crenarchaeota*, DHVE: deep-sea hydrothermal vent *Euryarchaeota*
