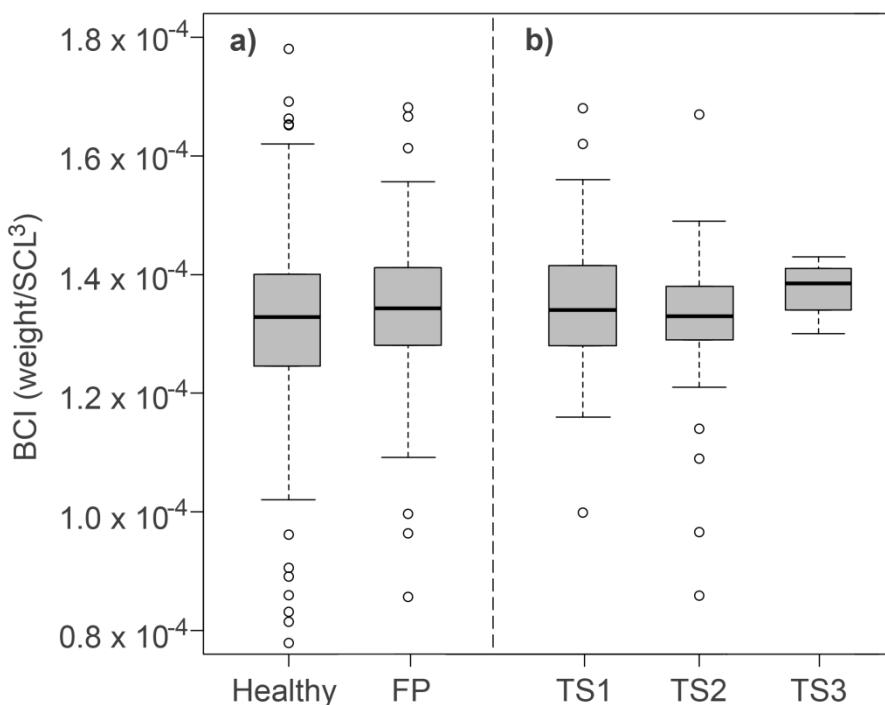

Figure S1. (a) Body condition index (BCI; Bjorndal et al. 2000) at each capture of immature green turtles at Puerto Rican foraging grounds when healthy ($n = 679$) and with fibropapillomatosis (FP, $n = 85$). (b) BCI at each capture corresponding to turtles with FP ($n = 85$), according to tumour score. TS1: mild form of FP, TS2: moderate FP, and TS3: severe FP (Work & Balazs 1999). SCL = straight carapace length. Boxes show the median, lower and upper quartile of the distribution, whiskers extend to the lowest or highest value within 1.5 times the distance between the lower and upper quartile, dots represent outliers

Table S1. Number of individual captures of immature green turtles per year at two Puerto Rican foraging sites, Puerto Manglar and Tortuga Bay, and annual prevalence of fibropapillomatosis (FP). No data were collected in 1999
