Figure S1 Development of relative abundances of the four phytoplankton species responsive to pCO$_2$ and iron sources. The relative contribution of *Nitzschia lecointei* (blue), *Chaetoceros neogracilis* (pink), *Fragilariopsis curta* (turquoise) and *Phaeocystis antarctica* (grey) is shown after incubation of control-, dust-, and FeCl$_3$-treatments in response to 390 and 900 µatm pCO$_2$ at the end of the first and second experimental phase.
