

The following supplement accompanies the article

Physiological integration of coral colonies is correlated with bleaching resistance

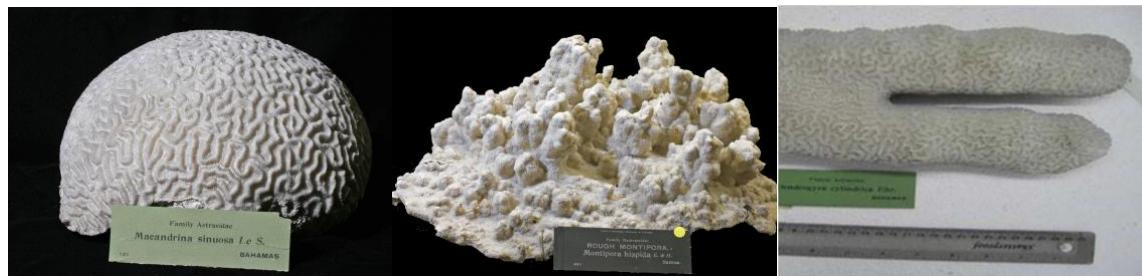

Timothy D. Swain, Emily C. Bold, Phillip C. Osborn, Andrew H. Baird,
Mark W. Westneat, Vadim Backman, Luisa A. Marcelino*

Supplement 2. Illustrated glossary of colony integration characters

Growth form

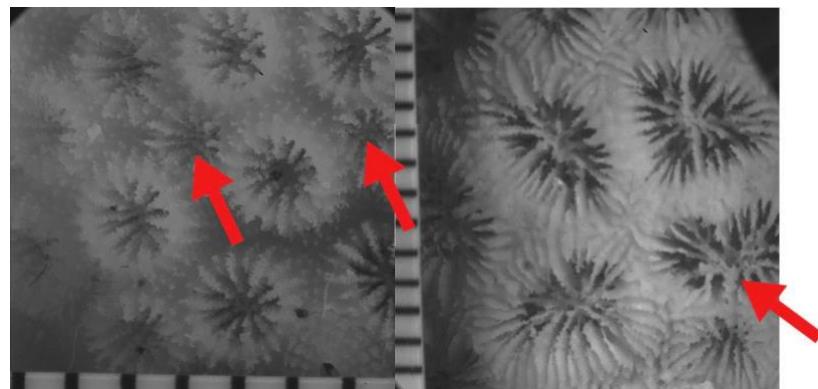

0 = massive
(*Pseudodiploria strigosa*) 0 = encrusting
(*Montipora* sp.) 0 = columnar
(*Madrepora radula*)

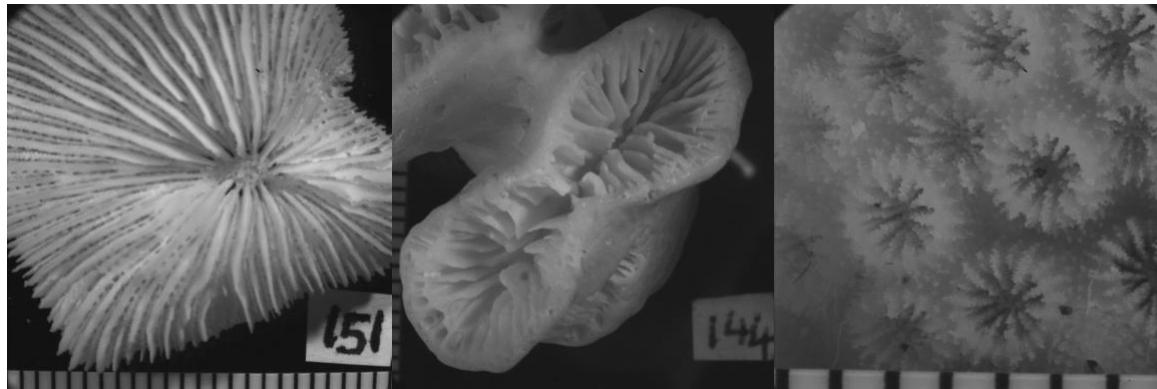

0.5 = laminar
(*Echinopora concinna*) 1 = branching or digitate
(*Acropora cytherea*)

Budding type

0 = extracalicular budding
(*Cyphastrea microphtalma*) 1 = intracalicular budding
(*Favia fragum*)

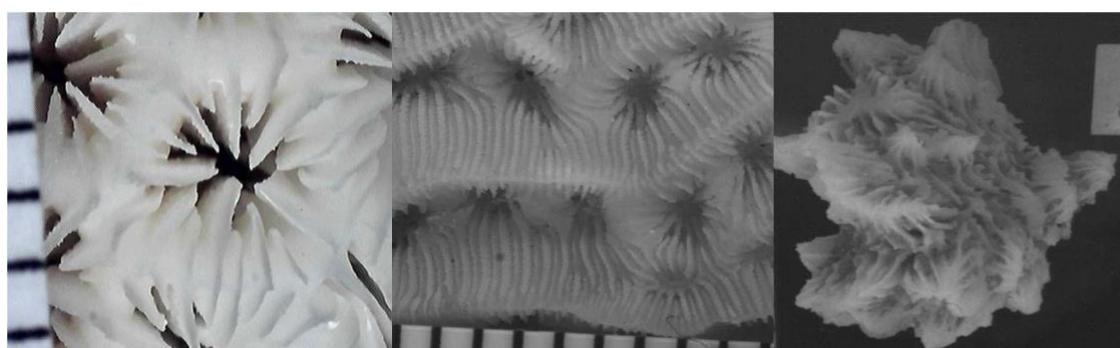

Colony formation

0 = solitary
(*Fungia fungites*)

0 = phaceloid
(*Euphyllia glabrescens*)

0.25 = plocoid
(*Cyphastrea microphthalma*)

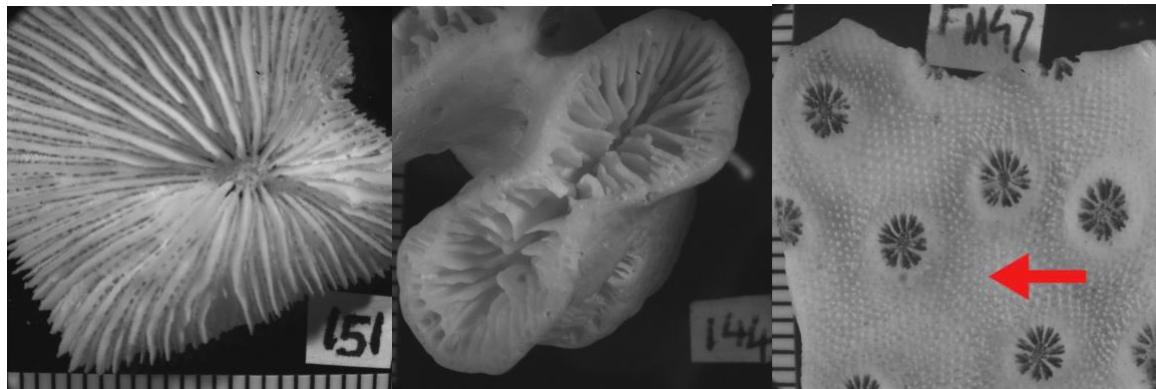

0.5 = cerioid
(*Coeloseris mayeri*)

0.75 = meandroid
(*Agaricia agaricites*)

1 = hydnophoroid
(*Hydnophora exesa*)

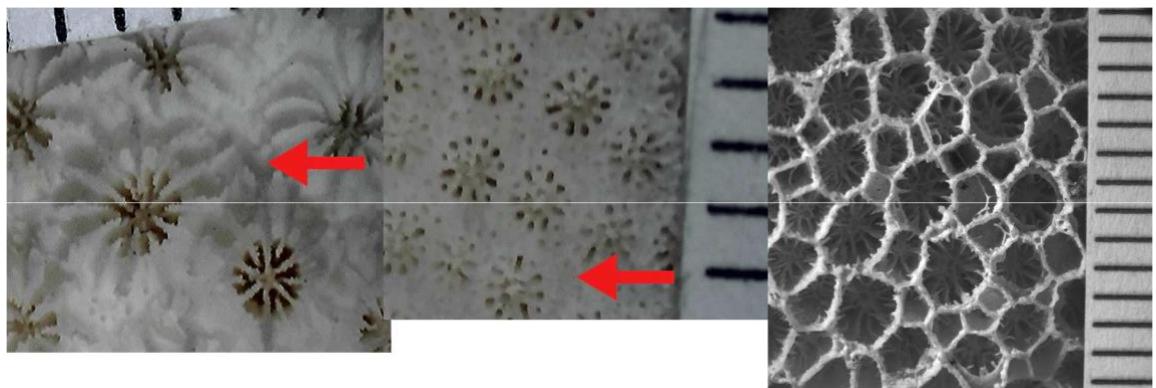

Coenosteum amount
(arrows indicate location of coenosteum)

0 = solitary
(*Fungia fungites*)

0 = phaceloid
(*Euphyllia glabrescens*)

0.25 = extensive
(*Echinopora taylorae*)

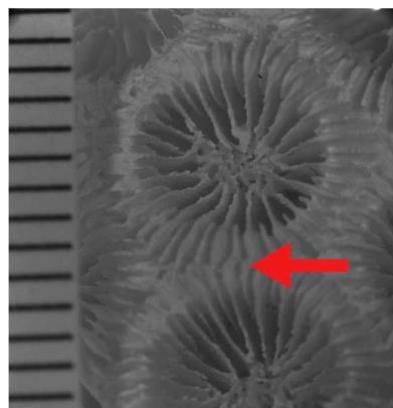

0.5 = moderate
(*Cyphastrea chalcidicum*)

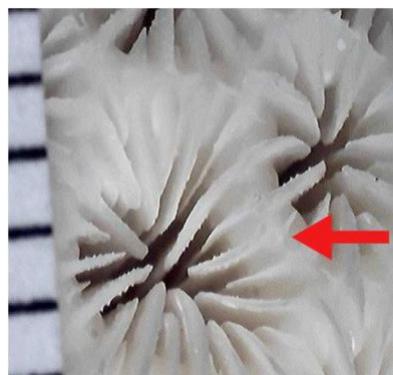

0.75 = limited
(*Porites lobata*)

1 = fused walls
(*Alveopora daedalea*)

Inter-corallite continuity of costosepta
(arrows show location of costa)

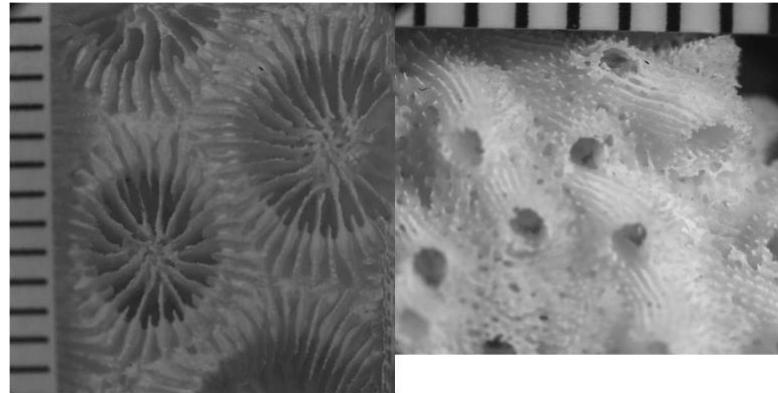

0 = mostly not confluent
(*Monastraea cavernosa*)

1 = mostly confluent
(*Coeloseris mayeri*)

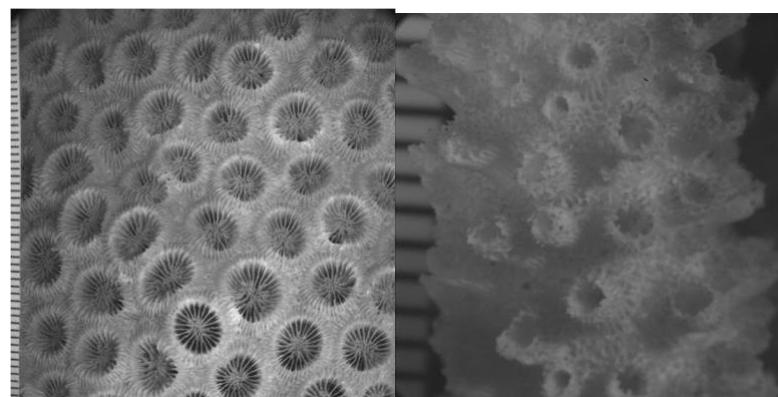

Perforate skeleton

0 = imperforate
(*Monastraea cavernosa*)

1 = perforate
(*Acropora hyacinthus*)

Polymorphic polyps

0 = no

(*Monastraea cavernosa*)

1 = yes

(*Acropora cervicornis*)
