Figure S1. Sensitivity analysis for the level of inbreeding depression included in the simulation models. Lambda: geometric growth rate. The number of lethal equivalents ranged from -1.4 to 30.3 (based on 40 captive mammalian populations belonging to 38 species; Ralls et al. 1988). Vertical bars show standard errors.
Figure S2: Temporal autocorrelation (ACF) and partial temporal autocorrelation (PACF) functions for the log-linear regression of counts against year over the study period (1999-2014).
