Fig. S1. Number of individuals included in each of the 159 groups used in the proportional response variables presented in Table 2 in the main article.

Fig. S2. Lice infestations presented as either number of lice vs. fish length (upper panels) or number of lice per gram fish weight (lice.g-1) vs. weight (lower panels) for the full dataset (left panels) and the subset of data used for the proportional response variable in Table 2 of the main article (right panels).

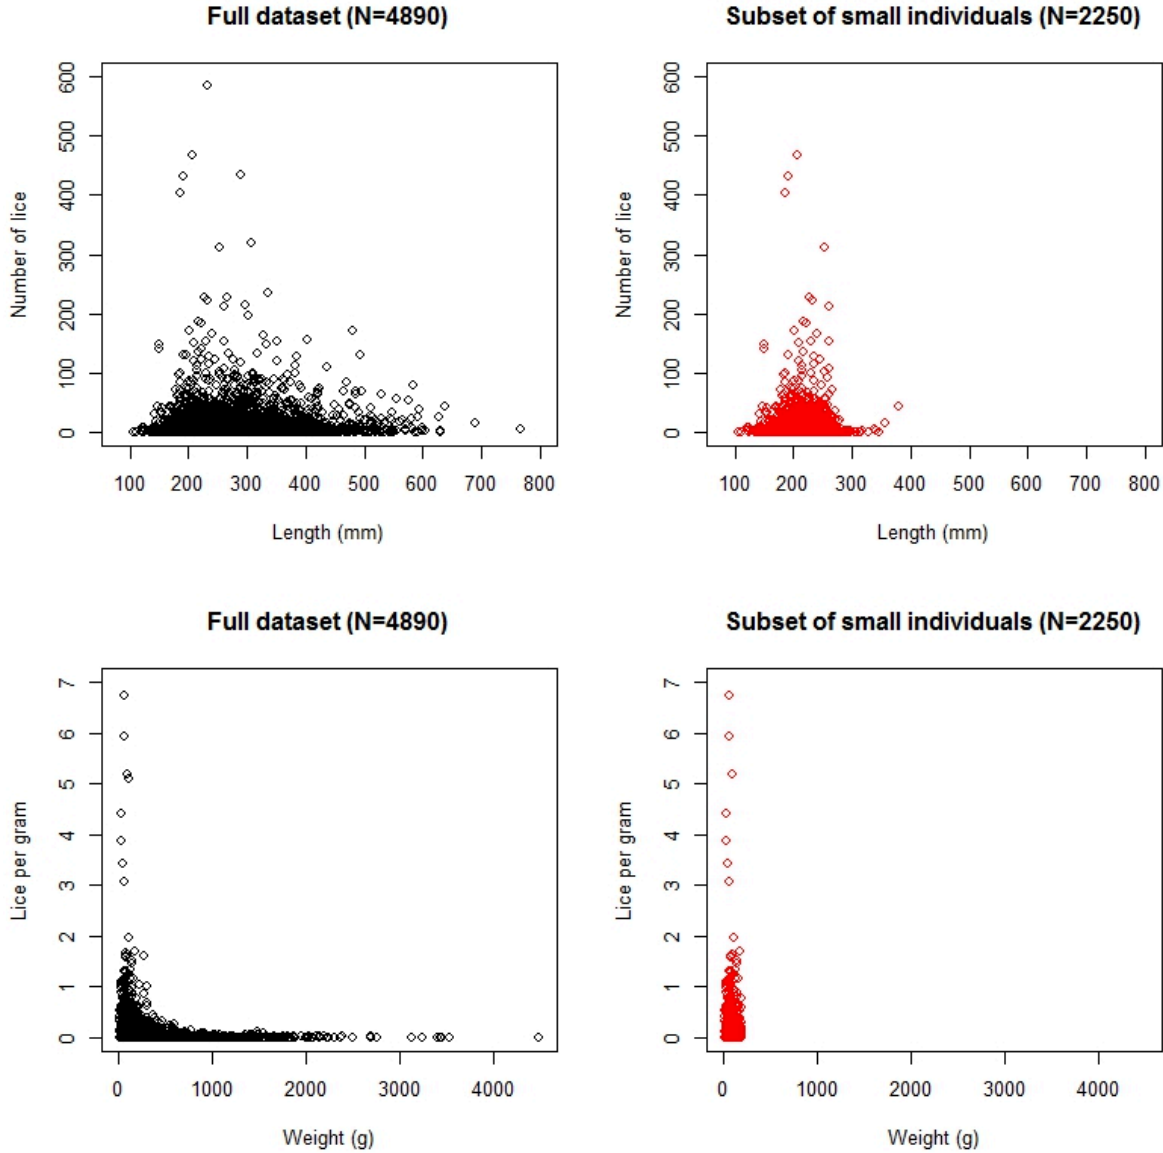

Fig. S3. Proportion of wild sea trout with lice levels above 0.1, 0.05 and 0.025 lice per gram fish weight (lice.g-1) in each of the 159 samples included in the analyses presented in Table 2 in the main article. Zero-values (i.e. no fish in the sample is above the given threshold value) are plotted in black, while the remaining data are presented with grey symbols.
